Sequences B33963-B34006 represent the amino acid sequences of 48 human secreted proteins encoded by the genes C59392-C59439. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast an ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, altergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus,
                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antilinfamatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disord neurological disease; infection; human; secreted protein.
                                  ischaemias; (d) wound healing; (e) neurological diseases anoxia and epilepsy; and (f) infectious diseases such as bacterial, fungal and parasitic infections.
                                                                                              Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial

                                                                                                                                                                  as compared to the human protein only.

The invention relates to 95 novel genes and their fragments (nucleic acid sequences: 224811-224907; amino acid sequences Y41308-Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 95 polynucleotides, based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-APR-1998;

                                                                                                                                                                                                                                                                               This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. Z24802) for increasing the stability of the fused protein
                                                                                                                       Sequence

The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method comprises contacting a permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides which are functional, well folded represent clones selected after panning primary and somatic NNK libraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone,

ESTROGEN RECEPTOR BETA (ER-BETA).
                                                                                                                                                                                                                                                                                                                      Walther N., Lioutas C., Tillmann G., Ivell R.;

"Cloning of bovine estrogen receptor beta (Erbeta): expression of novel deleted isoforms in reproductive tissues.";

MO1. Cell. Endocrinol. 152:37-45(1999).

-!- FUNCTION: BINDS ESTROGENS WITH AN AFFINITY SIMILAR TO THAT OF ER-ALPHA, AND ACTIVATES EXPRESSION OF REPORTER GENES CONTAINING ESTROGEN RESPONSE ELEMENTS (ERE) IN AN ESTROGEN-DEPENDENT MANUER.

MAY PLAY A ROLE IN OVARIAN FOLLICULAR GROWTH AND MATURATION.

-!- SUBUNIT: BINDS DNA AS A HOMODIMER. CAN FORM A HETERODIMER WITH ER-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Cloning, sequencing, and localization of bovine estrogen receptorbeta within the ovarian follicle."; Biol. Reprod. 60:691-697(1999).
